

Number : HW002  
Subject : Automatic Scroll

When displaying files on the TWIN CRT which exceed 80 characters (i.e. assembler list file) it may occur that after displaying the 25th line (last line) the first line is overwritten. Since the original line is not erased the information becomes difficult to decipher.

By selecting the automatic scroll feature within the CRT this problem can be solved. The following changes should be made to the logic card situated at the rear of the CRT.

#### Remove

Jumper B (if inserted)

#### Add

Jumper A  
Jumper D (probably already in place)  
Jumper C

NB: This modification is only applicable to PCB type 0686-0000  
(number is a left lower corner-component side).

# TWIN
